

SURFACE MOUNT TRAFFIC CONTROLLER TC-8

POSITIVE UNATTENDED ONE WAY TRAFFIC CONTROL

The Model TC-8 Surface Mount Sabre Tooth Traffic Controller can be quickly attached to existing driveways or new driveways (asphalt or cement) by means of bolts or epoxy. No excavation or cutting is required in normal installations. Any width driveway can be controlled by installing units end to end.

Because the TC-8 is all above grade, drainage problems are minimal. The TC-8 is fabricated from 1/4" steel plate and will carry the heaviest highway axle load expected in normal commerce.

LATCH DOWN

For locations where it is desired to occasionally deactivate the controller, the TC-8 is supplied with a "Latch Down Tool". The Latch Down Tool permits the operator to lock the teeth in the down position to allow free flow in either direction. Using a unique key only a few seconds per module is required to lock or unlock the teeth.

NON-PENETRATING

In some locations it is necessary to control wrong way traffic but the threat of disabling a stray vehicle is not necessary for enforcement. For these applications a Non-Penetrating version of TC-22 is available. The Sabre Teeth are replaced by a steel curb that is highly visible and equivalent to a 5 inches drive curb. While a passenger car can get over this barrier it is a heavy bump for both the front and back wheels. Smooth flow is maintained for free direction vehicles.
