Video Capture System

FEATURE

Today, an intelligent parking management system not only increases the profit of the parking facility, but also provides a reliable security system to protect all vehicels in the car park. All parkers are expecting a safe environment when he or she drives into a parking facility.

Utilizing the artificial intelligence, the Video Capture System is developed to prevent car theft. At the car park entrance, a camera captures an image of the entering vehicle and saved along with the ticket information in the database for future verification.

At the carpark exit, another camera captures the image of the exiting vehicle and retrive the stored picture, the attendant can then compare the image with the one stored earlier, including car model, colour, outline, and license number before raising the gate to allow the vehicle exit.

ADVANTAGE

* It can prevent the owner to use the same monthly pass for another use.
* Prevent a thief from trying to drive in an old car and steal an expensive car away.
* Reduce the burden of security guards.
* Stored pictures of left vehicles are saved for more weeks for future reference.
